

E4 Supplement Instructions

E4 systems require the following additions for any installation:

Threshold and jamb assembly: There is not a gasket for E4 Threshold so it is VERY important to CAULK between the threshold and the jambs. Water will get in the bottom guide channel and if the jambs are not caulked this water can come into the home.

Threshold Mounting: It is important to follow the guidelines on mounting the threshold to the foundation. Fasteners are NOT provided for this application since the type of foundation is not known.

Hardware Installation: E4 requires the BOTTOM portion of the hardware to be installed in the Bottom Guide track of the threshold LIKE the hardware is installed in the Top Track. Follow the same sequence for installing the bottom hardware into the threshold when you install the top portion into the top track.
